The National Electric Power Company (ENEE), through a loan from the Inter-American Development Bank (IDB), will modernize the National Dispatch Center with the new acquisition of a SCADA / EMS system.

Starting in July of this year, the installation of the new digital equipment will begin and the tests will be carried out later, projecting to have the equipment in optimal operation by December

The implementation of this new software and equipment will optimize the company's service, facilitating the control of the electrical network and integrating a telecommunications system that will support the coordination of operations, reliability and security of the national interconnected system.
